FIG. 1

The following example shows a sample extract of a XML file which describes an aggregate resource type.

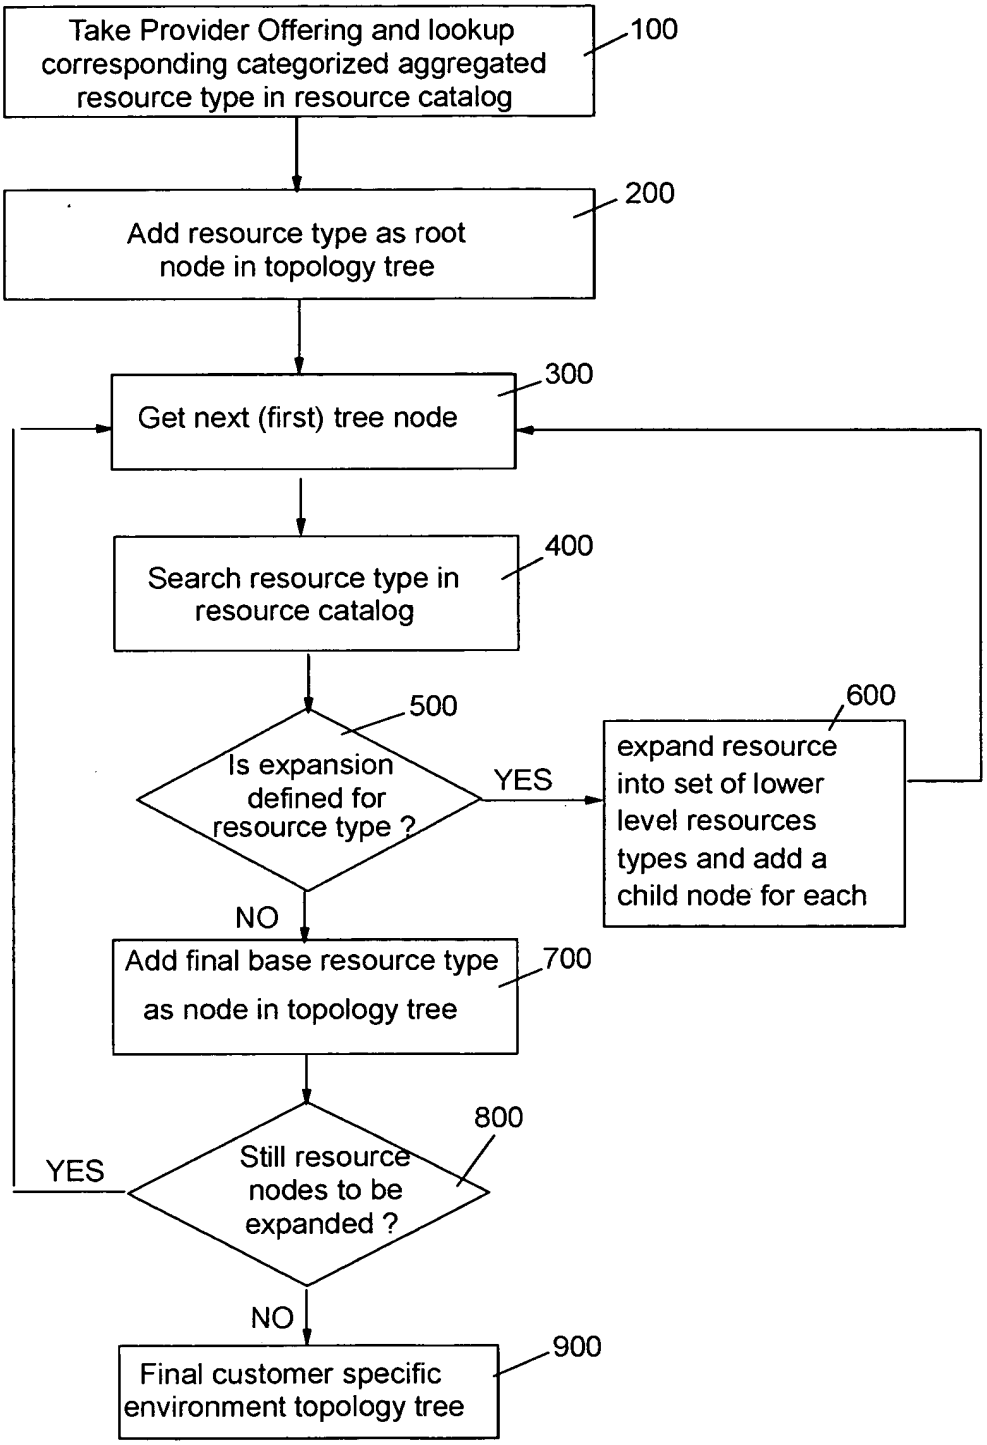
```
<?xml version="1.0" encoding="UTF-8"?>
<resourcetype>
	<identification>
		<name>SECURE WEBSERVER</name>
	</identification>
	<expansion>
		<node>
			<identification>
				<name>HTTP FIREWALL</name>
			</identification>
		</node>
		<node>
			<identification>
				<name>STANDARD WEBSERVER</name>
			</identification>
		</node>
	</expansion>
</resourcetype>
```

FIG. 2A

The following example shows a sample extract of a XML file which describes a base resource type.

```
<?xml version="1.0" encoding="UTF-8"?>
<resourcetype>
	<identification>
		<name>HTTP FIREWALL</name>
	</identification>
	<partWSDL>
		<wsdlURL>http://localhost:8080/
				FirewallServiceProvider.wsdl</wsdlURL>
	</partWSDL>
</resourcetype>
```

FIG. 2B



Take Provider Offering and lookup corresponding categorized aggregated resource type in resource catalog
100
Add resource type as root node in topology tree
200
Get next (first) tree node
300
Search resource type in resource catalog
400
Is expansion defined for resource type ?
500
YES
expand resource into set of lower level resources types and add a child node for each
600
NO
Add final base resource type as node in topology tree
700
Still resource nodes to be expanded ?
800
YES
NO
Final customer specific environment topology tree
900

Visit First Node
150
Visit next node
Extract interface description and store in interface repository
250
Extract input/output parameter and store in In/OutParmRepository
350
Last node in resource topology ?
no
yes
Generate parameter maps and store maps for each composite task
450
Determine sequence of subtasks within composite task based on in/out parameter dependencies
550
Store subtask I/F in complex task
650
